About This Manual

Overview and Scope

This manual describes Copley ASCII Interface developed by Copley Controls Corporation. This manual was written for the reader who has a basic knowledge of motion control theory and operation, Copley Controls amplifiers, and Copley Controls CME 2 software.

Related Documentation

See the user guides and data sheets for the amplifiers that will be programmed using the ASCII Interface. Also, the *Copley Controls Amplifier Parameter Dictionary* contains the complete list of amplifier variables. These documents can be found under *Documents* at:

http://www.copleycontrols.com/Motion/Downloads/index.html

Information on Copley Controls Software can be found at: http://www.copleycontrols.com/Motion/Products/Software/index.html

Comments

Copley Controls Corporation welcomes your comments on this manual. See http://www.copleycontrols.com for contact information.

Copyrights

No part of this document may be reproduced in any form or by any means, electronic or mechanical, including photocopying, without express written permission of Copley Controls Corporation.

Copley ASCII Interface, Copley Virtual Machine, CVM, Accelnet, Xenus, Stepnet, and CME 2 are registered trademarks of Copley Controls Corporation.

Document Validity

We reserve the right to modify our products. The information in this document is subject to change without notice and does not represent a commitment by Copley Controls Corporation. Copley Controls Corporation assumes no responsibility for any errors that may appear in this document.

Conventions Used When Describing Amplifier Variables

As in the example shown below, this manual contains many descriptions of amplifier variables.

The Bank column indicates whether a variable can be found in RAM (R), flash (F), or both (R F).

Variable 10	Bank	Description
0x3a	RF	Velocity loop velocity limit. Units: 0.01 counts/second.
0x36	RF	Velocity loop acceleration limit. Units: 1000 counts/second ² .
0x37	RF	Velocity loop deceleration Limit. Units: 1000 counts/second ² .
Oxc10	RF	Fast Stop Ramn, Units: 10 counts/second ² .

Product Warnings

Observe all relevant state, regional, and local safety regulations when installing and using Copley .a. atic Product. Controls amplifiers. For safety and to assure compliance with documented system data, only Copley Controls Corporation should perform repairs to amplifiers.

DANGER: Hazardous voltages.

Exercise caution when installing and adjusting.

Failure to heed this warning can cause equipment damage, injury, or death.

DANGER

Risk of electric shock.

Amplifier high-voltage circuits are connected to DC or AC power.

Failure to heed this warning can cause equipment damage, injury, or death.

DANGER

Using CME 2 can affect or suspend externally controlled operations.

When operating the amplifier under control of the ASCII Interface, use of CME 2 to change amplifier parameters can affect operations in progress.

DANGER

Using CME 2 to initiate motion can cause external program operations to suspend. The operations may restart unexpectedly when the CME 2 move is stopped.

Failure to heed this warning can cause equipment damage, injury, or death.

CHAPTER

1: Introduction

This chapter provides an overview of the Copley ASCII Interface, a set of commands that can be sent by an external controller to operate and monitor Copley Controls amplifiers.

Contents include:

Contents include: Section 1.1: The Copley ASCII Interface	Page
Contents include: Section 1.1: The Copley ASCII Interface	e is a Discontilladisc
Copley Controls Corp.	

1.1: The Copley ASCII Interface

The Copley ASCII Interface is a set of ASCII format commands that can be used to operate and monitor Copley Controls Accelnet, Stepnet, and Xenus series amplifiers over an RS-232 serial connection.

For instance, after basic amplifier configuration values have been programmed using CME 2, a control program can use the ASCII Interface to:

- Enable the amplifier in Programmed Position mode.
- Home the axis.
- Issue a series of move commands while monitoring position, velocity, and other run-time variables.

Commands and Variables

Some of the ASCII Interface commands read, write, and copy the values of a set of amplifier variables.

Some of these variables are used to control and monitor the amplifier's operating modes and states. For instance, variable 0x24, the "amplifier desired state" variable, is used to enable the amplifier in one of a variety of operating modes. Other variables are used to monitor run-time information.

Not all commands affect amplifier variables directly. For instance, the reset (r) command causes the amplifier to reset immediately, and the trajectory (t) command initiates and aborts moves.

RAM and Flash Memory Banks

Variables are maintained in the amplifier's RAM memory, flash memory or in both RAM and flash memory. When using commands to read, write, or copy variables, it is necessary to specify a memory bank.

Unlike flash values, RAM values are cleared with each amplifier reset. Any RAM variable with a flash counterpart is then written with the flash value. Thus, if the desired startup value is stored in flash, the external program need not write the RAM value on startup. For instance, if the desired initial Position Loop gains and limits were saved to flash using CME 2, these values would automatically be loaded into RAM on startup.

Any RAM value with no flash counterpart remains clear until updated by an external program or by a change in the value watched by the variable. For instance, the actual current variable (0x0c) updates to match the actual current value.

1.2: Communication Protocol

The protocol used is of the "speak when spoken to" variety. The amplifier will never initiate communications, but will always respond to commands with an acknowledgment, a returned

The baud rate of the amplifier will always be set to 9600 on power up or after a reset. Also, Copley amplifiers are designed to identify a break command on the serial port. A serial break command normally an illegal condition in which the serial port. transmitting serial line low for longer then a single byte of serial data. If such a condition is detected by the amplifier, it will flush any pending input data, reset the amplifier's baud rate to 9600, and wait for a new command to be received on its serial port. The amplifier will never initiate a break command itself.

Use the following protocol for Copley ASCII Interface communications:

Baud		9,600 to 115,200 (Defaults to 9,600 on power up or reset.)
Data F	ormat	N, 8, 1

2.1: Copley ASCII Message Format

The general syntax of a Copley ASCII message is:

[optional node ID] <command code> [<command specific parameters>...] <CR> where:

- [optional node ID] is the CAN node address of an amplifier in a multi-drop network. Range is 0-127. The node ID is followed by a single space.
- blognicg. <command code> is the single-letter code for one of the Copley ASCII commands described below. It is followed by a single space, or, in the case of the Reset command, a carriage return character.

Command Code	Description
s	Set the value of a variable in ram or flash.
g	Get the value of a variable in ram or flash.
С	Copy the value of a variable from ram to flash or flash to ram.
r	Reset the amplifier.
t	Trajectory generator command.
i	Read or write the value of a CVM program register.

- man ared by so also the some and the some area of the some area. <command specific parameters> tell the command what to act on and how. If more than one parameter is required, they should be separated by spaces.
 - <cr> is a carriage return character that ends the command line.

2.2: Set (s) Command

The **s** command is used to set values of writeable amplifier variables.

The syntax of the **s** command is:

[optional node ID] s <memory bank><variable ID> <value>...]<CR>

where:

- Kolowstic Product. [optional node ID] is the CAN node address of an amplifier in a multi-drop network. Range is 0-127. It is followed by a single space.
- **s** is the Set command code. It is followed by a single space.
- <memory bank> identifies which memory bank to set the variable in.
 - f = flash memory
 - r = RAM memory
- <variable ID> identifies the variable to set. Variable ID format can be decimal or hexadecimal.
- <value> is the new value(s) to be set in the variable. Value can be sent in integer or hexadecimal format. If multiple values are required, they are separated by spaces.

<CR> is a carriage return character which immediately follows the last value.

The amplifier responds to the **s** command with:

- **ok<CR>** if the command is accepted.
- e <error #><CR> if the command was not accepted. See Error Codes (p. 75).

\$	S Command Exa	mples	
(Command	Response	Comment XXX
s	s r0x30 1200	ok	Set variable 0x30 (position loop proportional gain) to 1200 in RAM. The "ok" response indicates that the command executed successfully.
	s f0x30 1200	ok	Set variable 0x30 (position loop proportional gain) to 1200 in flash. The "ok" response indicates that the command executed successfully.
s	s r 0x30 1000	e 33	Attempted to set 0x30 to 1200 in RAM. Error 33 (ASCII command parsing error) was returned. Note the extra space before the variable 1D.
	STOX30 1000	ol Mailar	
	Mariana	96	
(CP	Simalis		
Theis			

2.3: Get (g) Command

The **g** command is used to get the values of amplifier variables.

The syntax of the **g** command is:

[optional node ID] g <memory bank><variable ID><CR>

where:

- Kolomatic Product. [optional node ID] is the CAN node address of an amplifier in a multi-drop network. Range is 0-127. It is followed by a single space.
- **g** is the Get command code. It is followed by a single space.
- <memory bank> identifies which memory bank to get the variable from.
 - f = flash memory
 - r = RAM memory
- **<variable ID>** identifies the variable to get. Variable ID format can be decimal or hexadecimal.
- <CR> is a carriage return character which immediately follows the variable ID.

The amplifier responds to the Get command with:

- v [value]<CR> where value equals the contents of the variable. If the variable contains multiple values, they will separated by spaces.
- e <error #>(CR) if the command was not accepted. See Error Codes (p. 75).

	g Command Ex Command g r0x30	Response v 1200	Comment Get the value of variable 0x30 (position loop proportional gain) from RAM. Example shows a value of 1200 returned.
	g f0x17	e 15	Attempted to read variable 0x17 (actual motor position) from flash. Error 15 (Variable doesn't exist on requested page) was returned. Note that actual motor position is stored in RAM only.
<	g f0x17	loc anailar	
The	Mainu		

2.4: Copy (c) Command

The c command is used to copy the value of a variable from one memory bank to another (RAM to flash or flash to RAM).

The syntax of the **c** command is:

where:

- [optional node ID] is the CAN node address of an amplifier in a multi-drop network.
 Range is 0-127. It is followed by a single space.
 c is the Copy command code. It is followed by a single space.
 <memory bank> identifies which memory bank is the source.
 f = flash memory
 r = RAM memory
 <math display="block">variable ID> identifies the variable to copy. Variable ID formations are carried as a c

- **<CR>** is a carriage return character which immediately follows the variable ID.

The amplifier responds to the **c** command with:

- **ok<CR>** if the command is accepted.
- e <error #>(CR) if the command was not accepted. See Error Codes (p. 75).

	c Command Ex	camples	Comment
	Command	Response	Comment
	c r0x30	ok	Copy the value of 0x30 from RAM to flash. The "ok" response indicates that the command executed successfully.
	c f0x30	ok	Copy the value of 0x30 from flash to RAM. The "ok" response indicates that the command executed successfully.
The id	c f0x30	ade availar	Je tot liee

2.5: Reset (r) Amplifier Command

[optional node ID] is the CAN node address of an amplifier in a multi-drop network.

Range is 0-127. It is followed by a single space.

r is the Reset command code.

<CR> is a carriage return character which immediate amplifier does not respond to the contract of the co The r command is used to immediately reset the amplifier. The command requires no additional parameters. The amplifier baud rate is set to 9600 when the amplifier restarts.

The syntax of the Reset command is:

where:

The amplifier does not respond to the r command with an ASCII message.

r Command Example

Command Comment Response Amplifier is reset. {none}

on a a. This is a can be said the control of the co NOTE: if a reset command is issued to an amplifier on a multi-drop network, error code 32, "CAN Network communications failure," will be received. This is because the amplifier reset before responding to the gateway amplifier. This error can be safely ignored in this circumstance.

2.6: Trajectory (t) Generator Command

The t command controls the trajectory generator. It can initiate a new move, update a move in progress, or start a home sequence. It can also abort a move.

The syntax of the **t** command is:

where:

- rere:

 [optional node ID] is the CAN node address of an amplifier in a multi-drop network. Range is 0-127. It is followed by a single space.

 t is the Trajectory command code. It is followed by a single space.

 <sub-command>
 0 = Abort move
 1 = Initiate/update move
 2 = Initiate home sequence

 <CR> is a carriage return character which immediate.

 amplifier responds to the * command to the * comma

The amplifier responds to the **t** command with:

- ok<CR> if the command is accepted. An "ok" response only indicates the command was accepted by the amplifier. Monitor the trajectory status register to verify that motion has actually been initiated.
- e <error #>(CR) if the command was not accepted. See Error Codes (p. 75).

t Command Examples

	Command	Response	Comment Initiate a move.
	t 1	ok	Initiate a move.
	t2	e 33	Attempted to initiate a homing sequence. Error 33 (ASCII command parsing error) was returned. Note there is no space between the command and sub-command.
			15e ⁵ 15 ^e
		or which	
	*Pctus	396 376	
4	Sugish		
The C	Manue		Initiate a move. Attempted to initiate a noming sequence. Error 33 (ASCII command parsing error) was returned. Note there is no space between the command and sub-command.

2.7: Register (i) Read and Write Command

The Register command (i) is used to read and write the CVM program's 32 internal registers.

The syntax of the i command is:

[optional node ID] i <r#> [<value>]<CR>

where:

- Kolomatic Product. [optional node ID] is the CAN node address of an amplifier in a multi-drop network. Range is 0-127. It is followed by a single space.
- i is the Register command code. It is followed by a single space.
- <r#> identifies which register is being accessed.
 - # = Equals the number of the register (0 31).
- <value> is the new value to be written into the register. If <value> is omitted from the command then the contents of the register will be returned. Value can be sent in integer or hexadecimal format.
- <CR> is a carriage return character which immediately follows the register number or the value.

The amplifier responds to the i command with:

- **ok<CR>** if the command is accepted and the value is written to the register.
- **r [value]<CR>** where value equals the contents of the register.
- e <error #>(CR) if the command was not accepted. See Error Codes (p. 75).

i	Comn	nand	Exam	oles
•	COIIIII	IUIIU	LAUIII	3103

	Command	Response	
	i r0 15	ok	Write the value "15" to the first register (register 0).
	i r0	r 15	Read the value of the first register (register 0). Example displays a returned value equal to 15.
The	Riro Rinathactua	r 35	Read the value of register 0 on amplifier with CAN node ID of 8. Example displays a returned value equal to 35.

CHAPTER

3: OPERATING MODES the amplifier's operating modes.

This chapter describes the variables related to the amplifier's operating modes. Contents include:

33	Digital Input Position Mode, Stepper
inis n	Digital Input Position Mode. Programmed Position Mode, Stepper. Digital Input Position Mode, Stepper. Digital Input Position Mode, Stepper. Digital Input Position Mode, Stepper.
20	Copley Contro

3.2: Current Mode

3.2.1: Programmed Current Mode

When the amplifier is enabled in this mode, or when the programmed current level is changed, the output current ramps to the new level at the programmed rate.

Programmed Current Mode Variables

Variable ID Bank Description

0x24 R F Desired state:

0 = Disabled

Variable ID	Bank	Description
0x24	RF	Desired state:
		0 = Disabled.
		1 = Programmed Current Mode.
0x02	RF	Programmed current value. Units: 0.01 A.
0x6a	RF	Current ramp rate. Units: mA/second.
		A value of zero in this register results in a step change.

NOTE: When changing both the level and the ramp parameters while the amplifier is enabled, change the ramp rate first.

Programmed Current Mode Example

Enable the amplifier in Programmed Current Mode. Ramp the output current up to 2 A in 0.5 seconds. The controller monitors the output current, and after it reaches 2 A the current is ramped down to 1 A in 2 seconds.

Command	Response	Comment
s r0x6a 4000	ok	Set ramp rate to 4 A/second.
s r0x02 200	ok	Set the output level to 2 A.
s r0x24 1	ok	Enable the amplifier in Programmed Current Mode. Output current will start increasing at a rate of 4 A/second.
The controller use	es the following co	mmand to monitor the output current.

Reads actual current output from the amplifier. Example displays a g r0x0c returned value equal to 1.50 A.

After the output current reaches 2 A, the controller sends the new ramp and level parameters.

s r0x6a 4000 Set new ramp rate of 0.5 A/second. ok

Change the output level to 1 A. Output current will start decreasing at s r0x02 100

a rate of 0.5 A/second.

The Ranualis made available and the Ranualis made The controller disables the amplifier.

Disable the amplifier.

3.2.2: Analog Current Mode

In the Analog Current Mode, the current output of the amplifier is proportional to the analog reference input command signal.

reference input command signal.				
Analog Curre	riables	<i>y</i> .		
Variable ID	Bank	Description		
0x24	RF	Desired state.		
		0 = Disabled		
		2 = Analog Current Mode.		
0x19	RF	Analog input scaling factor. Amount of current commanded per 10 volts of input. Units: 0.01 A.		
0x26	RF	Analog input dead band. Units: mV.		
0x1a	RF	Analog input offset. Units: mV.		

NOTE: Variables 0x19, 0x26 and 0x1a are used in Analog Current, Velocity and Position modes. Verify that these variables are set correctly before switching between these modes of operation.

Analog Current Mode Example

The controller sets the scaling, enables the amplifier in Analog Current Mode, monitors the current output, and changes the scaling to a new value.

output, and ci	output, and changes the scaling to a new value.			
Command	Response	Comment		
s r0x19 1000	ok	Set scaling factor to 10V = 10A.		
s r0x24 2	ok	Set amplifier to Analog Current Mode.		

The controller uses the following command to monitor the output current.

Jual condition to determine the amplifier. Reads actual current output from the amplifier. Example displays a g r0x0c v 525

returned value equal to 5.25 A.

Set scaling factor to 10V

3.2.3: PWM Current Mode

In the PWM Current Mode, the current output of the amplifier is proportional to the duty cycle of the input command signal. In most applications the command signal configuration is set using CME 2 and not changed during operation.

PWM Current Mode Variables

Variable ID	Bank	Description
0x24	RF	Desired state.
		0 = Disabled 3 = PWM Current Mode.
0xa9	RF	Digital input scaling factor. Amount of current commanded at 100 percent duty cycle. Units: 0.01 A.
0xa8	RF	Digital input command configuration normally set using the CME 2 PWM Command screen. See table below for definition of the values.

NOTE: Variables 0xa9 and 0xa8 are used in PWM Current and Velocity modes. Verify that these variables are set correctly before switching between these modes of operation.

PWM Current Mode Example

The controller sets the scaling, enables the amplifier in PWM Current Mode, and monitors commanded and actual current.

Command	Response	Comment
s r0xa9 1000	ok	Set scaling factor to 10A.
s r0x24 3	ok	Enable the amplifier in PWM Current Mode.
The controller uses t	he following com	mands to monitor the commanded and output currents .
g r0x15	v 500	Reads commanded current from the amplifier. Example displays a returned value equal to 5 A.
g r0x0c	v 495	Reads actual current output from the amplifier. Example displays a returned value equal to 4.95 A.
The controller disable	es the amplifier.	his iti

3.4: Position Mode

3.4.1: Updating Trajectory Variables in Position Modes

When the amplifier enters a position mode, the trajectory variables (velocity, acceleration and deceleration) are copied into the trajectory generator. To change any of them after the amplifier is in a position mode, send the new value to the appropriate variable and then send a *t* 1command.

3.4.2: Programmed Position Mode

In the Programmed Position Mode, the axis moves to target positions sent to the amplifier over the serial interface. The target positions can be absolute or relative from the current position. The motion profile used can be set to trapezoidal or S-curve.

To initiate a move, first set the appropriate variables and then send the trajectory command *t* 1 to start the move (see *Trajectory (t) Generator Command*, p. 17). When using the trapezoidal profile, the move parameters can be changed during the move. Again, first set the appropriate variables and then send another *t* 1 command. When the *t* 1 command is received, the target position, absolute / relative, velocity, acceleration and deceleration rates will be updated. In this manner, the move in progress can be changed. The S-curve profile cannot be updated in this manner.

To abort a move in progress, send a *t 0* command. This will stop the move in progress using the abort deceleration rate. The amplifier will remain enabled.

A special velocity mode can be used to move the axis using the velocity, acceleration and deceleration of the trapezoidal profile but with no specific target position. Direction of motion is set by entering a "1" or "-1" into the position command variable. Once started, the move will continue until the velocity variable is set to zero and a t 1 command is sent or a t 0 abort command is sent.

Programmed Position Mode Variables

Variable ID	Bank	Description
0x24	RF	Desired state.
		0 = Disabled
		21 = Programmed Position Mode, Servo
		31 = Programmed Position Mode, Stepper
0xc8	RF	Profile type.
	%;	0 = Absolute move, trapezoidal profile. 1 = Absolute move, S-curve profile.
	MICI	256 = Relative move, trapezoidal profile. 257 = Relative move, S-curve profile.
×	0, 18/11	2 = Velocity move.
0xca	R F	Position command. Units: counts.
C.C.	0	Relative move = the distance of the move.
x P	5	Absolute move = the target position of the move.
all do		Velocity move = 1 for positive direction, -1 for negative direction.
0xcb	RF	Maximum velocity. Units: 0.1 counts/second.
0xcc	RF	Maximum acceleration rate. Units: 10 counts/second ² .
0xcd	RF	Maximum deceleration rate. Units: 10 counts/second ² .
0xce	RF	Maximum jerk rate. Units: 100 counts/ second ³ .
0Xcf	RF	Abort deceleration rate. Units: 10 counts/second ² .

NOTES: 1) Maximum jerk rate is not used in the trapezoidal profile. 2) In the S-curve profile, the maximum deceleration rate is note used. The maximum acceleration rate is used for both acceleration and deceleration.

Programmed Position Mode Example

The controller sets profile parameters, executes an absolute trapezoidal move to position 40,000 counts, monitors for move completion, and then executes a relative move of 10,000 counts using matic Product. the same profile parameters.

Command	Response	Comment
s r0xc8 0	ok	Set the trajectory generator to absolute move, trapezoidal profile.
s r0xca 40000	ok	Set the position command to 40000 counts.
s r0xcb 70000	ok	Set maximum velocity to 7000 counts/second.
s r0xcc 200000	ok	Set maximum acceleration to 2000000 counts/second ² .
s r0xcd 200000	ok	Set maximum deceleration to 2000000 counts/second ² .
s r0x24 21	ok	Enable the amplifier in Programmed Position (Trajectory Generator) Mode.

The controller verifies actual axis position before starting move.

g r0x32 Read actual position. Example displays an actual position of 0.

t 1 ok Execute the move.

The controller monitors the event status register to determine when the move has been completed.

v 134217728 The controller monitors bit 27 of the event status register to

> determine when the move is complete. Example displays a status register value of 134217728. When this is decoded, it shows that bit

27 is set meaning the axis is in motion.

After the controller determines that motion has stopped, it checks the trajectory status register to see if the move was aborted for any reason.

The controller checks bit 14 of the trajectory status register to a r0xc9 v 4096

determine if the move was aborted. Example displays a status register value of 4096. When this is decoded, it shows that bit 14 is

not set meaning the move was not aborted.

The controller sets the trajectory configuration and commanded position variables to their new values and executes the new move.

Set the trajectory generator to relative move, trapezoidal profile. s r0xc8 256 ok

Set the position command to 10000 counts. s r0xca 10000 ok

Execute the move. t 1 ok

The controller aborts the move.

Motion stops and the amplifier is left enabled

ne amplifier ok williah kan analifah kan ana Disable the amplifier.

3.4.3: Analog Position Mode

In the Analog Position Mode, the axis position is commanded by the analog reference input command signal.

The analog position command operates as a relative motion command. When the amplifier is enabled the voltage on the analog input is read. Then any change in the command voltage will move the axis a relative distance, equal to the change in voltage, from its position when enabled. To use the analog position command as an absolute position command, the amplifier should be homed every time it is enabled.

Analog Position Mode Variables

Variable ID	Bank	Description
0x24	RF	Description Desired state.
UNE I		0 = Disabled 22 = Analog Position Mode.
0x19	RF	Analog input scaling factor. Commanded position per 10 volts of input. Units: counts.

CR Smartacitud	or which	Analog input offset. Set to 0 when in this mode of operation. Maximum velocity. Units: 0.1 counts/second. Maximum acceleration rate. Units: 10 counts/second ² . Maximum deceleration rate. Units: 10 counts/second ² . Abort deceleration rate. Units: 10 counts/second ² . 0x26 and 0x1a are used in Analog Current, Velocity and Position riables are set correctly before switching between these modes of lirection of motion with respect to the polarity of the command voltage, egative value.

Analog Position Mode Example

The controller sets the move parameters, homes the axis and then places the amp in the Analog Position Mode. The controller monitors actual position. The controller then changes the maximum velocity and scaling factor.

Command	Response	Comment
s r0x19 4000	ok	Set analog scaling to 4000 counts per 10V.
s r0xcb 70000	ok	Set velocity to 7000 counts/second
s r0xcc 20000	ok	Set acceleration to 200000 counts/second ²
s r0xcd 20000	ok	Set deceleration to 200000 counts/second ²
s r0x24 21	ok	Amplifier set in Programmed Position Mode required for homing.
t 2	ok	Execute homing. Assumes all homing parameters have been previously set.
The controller monit	tors the trajectory	status register to determine when the axis has been homed.
g r0xc9	v 8192	Controller checks bit 12 of the trajectory status register to determine if the axis was homed successfully. Example displays a status register value of 8192. Decoded, this value shows that bit 12 is not set, meaning the axis has not finished homing.
After a successful h	oming the contr	oller changes the amplifier's operating mode

After a successful homing, the controller changes the amplifier's operating mode.

s r0x24 22 Amplifier set in Analog Position Mode οk

t 1 This command will guarantee all new move parameters are in effect. ok

The controller monitors actual motor position.

g r0x32 v 2012 Reads actual motor position from the amplifier. Example displays a returned

value equal to 2012 counts.

The controller changes velocity and scaling variables

ables
acity to 2
analog scalin
This command req
at.

Disable the amplifier. Set velocity to 2000 counts/second

Set analog scaling to 1000 counts / 10V input.

This command required for new velocity to take effect.

3.4.4: Pulse and Direction Mode

In the Pulse and Direction Position Mode, the axis position is commanded by pulses applied to one of the amplifiers digital inputs. The direction of the commanded move is determined by the logic level of a second digital input.

The scaling factor sets the ratio of position command, in counts, for each input pulse. This ratio is stored in variable 0xa9 as two 16 bit words. The first word stores the numerator or number of position counts. The second stores the denominator or the number of input pulses.

Example: To set a ratio of 10 counts of position change for every input pulse.

The ration would be 10/1. To make sending the data easier, it should be converted to hex word format so the ratio would now be 0x000a / 0x0001. The two words can now simply be combined and sent to the amplifier by sending the command *s r0xa9 0x000a0001*.

To invert the direction, the numerator should be set to a negative value.

Example: Changing direction of the previous example would require a ratio of -10/1. Using the 2's complement method, -10 is represented as 0xfff6 hex. The ratio in hex would now be 0xfff6 / 0x001. Combining these words, the command to be sent would be *s r0xa9 0xfff60001*.

3.4.5: Pulse Up/Down Mode

In the Pulse Up/Down Position Mode, the axis position is commanded by pulses applied to the amplifiers digital inputs. The direction of the commanded move is determined by which of the digital inputs the pulses are applied to.

The scaling factor sets the ratio of position command, in counts, for each input pulse. It is stored in variable 0xa9 as two 16 bit words. The first word stores the numerator or number of position counts. The second stores the denominator or the number of input pulses.

Example: To set a ratio of 10 counts of position change for every input pulse.

The ration would be 10/1. To make sending the data easier, it should be converted to hex word format so the ratio would now be 0x000a / 0x0001. The two words can now simply be combined and sent to the amplifier by sending the command *s r0xa9 0x000a0001*.

To invert the direction, the numerator should be set to a negative value.

Example: Changing direction of the previous example would require a ratio of -10/1. Using the 2's complement method, -10 is represented as 0xfff6 in hex format. The ratio in hex format would now be 0xfff6 / 0x001. Combining these words, the command to be sent would be s r0xa9 0xfff60001.

Pulse Up/Down Mode Variables

34		Copley Controls Corp.

3.4.6: Quadrature Mode

In the Quadrature Position Mode, the axis position is commanded by a master encoder with its A and B channels applied to the amplifier's digital inputs.

The scaling factor sets the ratio of position command, in counts, for each count of the master encoder. The scaling factor is stored in 0xa9 as two 16 bit words. Word 1 stores the numerator or number of position counts. Word 2 stores the denominator or the number of input counts. Example: To set a ratio of 10 counts of position change for every input count, the ratio would be 10/1. To make sending the data easier, the ratio should be converted to its hex equivalent (0x000a/0x0001). The two words can now be combined and sent to the amplifier by sending the command *s r0xa9 0x000a0001*.

To invert the direction, the numerator should be set to a negative value.

Example: Changing direction of the previous example would require a ratio of -10/1. Using the 2's complement method, -10 is represented as 0xfff6 in hex format. The ratio in hex format would now be 0xfff6/0x001. Combining these words, the command to be sent would be \$\$r0x49 0xfff60001.

Homing Example

The controller modifies the homing parameters, enables the amplifier in the Programmed Position Mode, initiates a homing sequence and then monitors homing status.

	•		
	Command	Response	Comment
	Setting the homing pa satisfactory.	arameters is only	y required if the home sequence stored in flash memory is not
	s r0xc2 544	ok	Sets the homing method to use the next index pulse as home.
	s r0xc4 40000	ok	Sets the slow velocity to 4000 counts/second.
	s r0xc6 1000	ok	Sets the home offset to 1000 counts.
	s r0x24 21	ok	Enables the amplifier in programmed position mode.
	t 2	ok C	Starts the homing sequence.

4.6: Reading/S	etting Digital Outputs		46
The CR smanual is mad	or which uses this with	ie is det.	
Copley Controls Cor	p.		39

4.1: Setting the Baud Rate

Variable 0x90 (R) controls the amplifier's serial port baud rate. To change the baud rate, write the new value to 0x90. For instance, to change the value to 19200: s r0x90 19200.

After the carriage return of the s command, no other characters should be sent at 9600 (by default, some programs automatically append a line feed). If more characters are sent at 9600, they may be misinterpreted as a break command and cause the amplifier to change back to 9600 baud.

When reading variable 0x90, note that the value received may not be the exact value set. This is because the amplifier sets the baud rate as close to the requested baud rate as possible given the internal clock frequencies of the amplifier's microprocessor.

4.2: Setting Limits and Gains

This section describes the variables used to set control loop limits and gains.

4.2.1: Current Loop Limits and Gains

Current Loop Limits Variables

Variable ID	Bank	Description
0x21	RF	Peak current limit. Units: 0.01 A.
0x23	RF	I ² T time limit. Units: mS.
0x22	RF	Continuous current limit. Units: 0.01 A.
0xae	RF	Current loop offset. Units: 0.01 A.

Current Loop Gains Variables

0x00	RF	Current loop proportional gain (Cp).
0x01	RF	Current loop integral gain (Ci).

4.2.2: Velocity Loop Limits and Gains

Velocity Loop Limits Variables <a>S

Variable ID	Bank	Description
0x3a	RF	Velocity loop velocity limit. Units: 0.01 counts/second.
0x36	RF C	Velocity loop acceleration limit. Units: 1000 counts/second ² .
0x37	RF	Velocity loop deceleration Limit. Units: 1000 counts/second ² .
0xcf	RF	Fast Stop Ramp. Units: 10 counts/second ² .

Velocity Loop Gains Variables

	Variable ID	Bank	Description
	0x27	RF	Velocity loop proportional gain (Vp).
	0x28	RF	Velocity loop integral gain (Vi).
The	Remaindis,		

4.2.3: Position Loop Gains

Position loop limits are described in *Position Mode* (p. 27).

Position Loop Gains Variables

Variable ID	Bank	Description	
0x30	RF	Pp - Position loop proportional gain.	
0x33	RF	Vff - Velocity feed forward.	
0x34	RF	Aff - Acceleration feed forward.	
0xe3	RF	Position loop gain multiplier. 100 equals a factor of 1.	

4.2.4: Filters

Velocity Loop Filters Variables

Variable ID	Bank	Description	
0x6b	RF	Velocity loop command filter co-efficients.	
0x5f	RF	Velocity loop output filter co-efficients.	1/40

Velocity Loops Filters Usage Notes

The velocity loop command and output filters should be set up using CME 2. If it is required that the filters be changed during operation, the following procedure should be used to determine the new filter co-efficients.

- 1 Set the filter up using CME 2.
 - On the CME 2 Main screen, click **V Loop**.
 - On the Velocity Loop screen, click Command Filter or Output Filter as desired.
 - On the Filter screen, choose the filter type, set the parameters, click Apply and then click Close.
- Use the CME 2 ASCII command line tool (Tools->ASCII Command Line) to read the 2 updated variable. For instance, to read the command filter variable:

Command	g r0x6B
Response	v -7936 200 0 775 1550 775 -12774 32763 5813

Write program instructions to update the appropriate variable with those values. 3 For instance, to write the command filter variable:

	Write program instructions to update the appropriate variable with those values.
	For instance, to write the command filter variable:
	Command s r0x6B -7936 200 0 775 1550 775 -12774 32763 5813

31		
_	Undefined	

Trajectory Register Variable (0xc9)

The trajectory register variable (0xc9) provides trajectory generator status information. 0xc9 is read-only, and available in RAM only (not Flash). Bit mapped values described below:

	trajectory register variable (0xc9) provides trajectory generato is read-only, and available in RAM only (not Flash). Bit mapp
Bit	Description
0-10	Reserved for future use.
11	Homing error. If set an error occurred in the last home attempt. Cleared by a home command.
12	Referenced. Set if a homing command has been successfully executed. Cleared by a home command.
13	Homing. Set when the amplifier is running a home command.
14	Set when a move is aborted. Cleared at the start of the next move.
15	In motion bit. If set, the trajectory generator is presently generating a profile.
Faul	t Register Variable (0xa4)
	fault register variable (0xa4) shows latching faults that have o is available in RAM only (not Flash).
Bit m	napped values described below:
Bit	Description
0	Fatal hardware error: the flash data is corrupt (CRC error).
1	Fatal hardware error: A/D offset is out of range.
2	Short Circuit.
3	Amp Over Temperature.
4	Motor Over Temperature.
_	

Bit	Description
0	Fatal hardware error: the flash data is corrupt (CRC error).
1	Fatal hardware error: A/D offset is out of range.
2	Short Circuit.
3	Amp Over Temperature.
4	Motor Over Temperature.
5	Over Voltage.
6	Under Voltage.
7	Feedback Error.
8	Motor Phasing Error.
9	Following Error.
10	Over Current (Latched).

Note that when a latching fault has occurred, bit 22 of the status register (0xa0) is set.

andition, was a subject to the control of the contr To clear a fault condition, write a 1 to the associated bit of the fault register (0xa4).

4.4: Reading Run Time Variables

This section describes the variables used to monitor run time conditions.

This section de	escribes the	variables used to monitor run time conditions.	
Current Loop	Run Time \	ariables	3.
Variable ID	Bank	Description	NI)
0x15	R	Commanded current. Units: 0.01 A.	00.

4.5: Re	ading D	Digital Inputs	la.
Input States \	Variable (0xa	a6)	
The high/low s	staton of the	amplifier's programmable digital inputs can be read using vari	iable Ova6

4.5: Reading Digital Inputs

Input States Variable (0xa6)

The high/low states of the amplifier's programmable digital inputs can be read using variable 0xa6. Each bit represents an input number as shown below. If an input is high, the corresponding bit is set to 1. If the input is low, the corresponding bit is set to 0.

For instance, if the value of 0xa6 is 33, the binary equivalent is 100001, showing that IN1 and IN6 are high and the other inputs are low.

0xa6 is read-only, and available in RAM only (not Flash). Bit mapped values described below.

NOTE: The number of programmable digital inputs varies depending on amplifier model. See the amplifier documentation.

	ampimo	doddinentation:
	Bit	Input
	0	Digital Input 1
	1	Digital Input 2
	2	Digital Input 3
	3	Digital Input 4
	4	Digital Input 5
	5	Digital Input 6
	6	Digital Input 7
	7	Digital Input 8

	12	Reserved
	13	Reserved
	14	Reserved
	15	Reserved
The CR	Marins	

4.6: Reading/Setting Digital Outputs

The amplifiers digital outputs can be programmed by CME 2 to reflect the state of any one or more of the amplifier's event status register bits. The outputs can also be configured so their state

The external controller, through the Output State variable, can set an output inactive or active. The actual level of the output pin however is determined by the Output Configuration was variable sets the actual controller. variable sets the actual output pin to be high or low when active. When the amplifier powers up or is reset, all outputs are initially inactive. To ensure that outputs are high, or off, after power up or reset, they should be configured as active low.

Configuring Outputs (0x70 - 0x73)

Before a controller program can set an output pin's active/inactive state, the output must be configured for program control. This is done by setting the appropriate bits in the output's configuration variable.

The output configuration variables start with 0x70 for Output 1 and run to 0x73 for Output 4, as described below. These variables require two values be sent with Set (s) command.

NOTE: The number of programmable digital inputs varies depending on amplifier mode. See the amplifier documentation.

Variable ID	Memory Bank	Description
0x70	RF	Output 1 Configuration.
		258 0 = Program Control, Active Low 2 0 = Program Control, Active High
0x71	RF	Output 2 Configuration.
		Same as Output 1
0x72	RF	Output 3 Configuration.
		Same as Output 1
0x73	RF	Output 4 Configuration.
		Same as Output 1

Setting Output States (0xab)

Writing the variable 0xab sets the active/inactive states of digital outputs that have been configured for program control. Each bit represents an output number as shown below. A bit value of 1 corresponds to an active output. A bit value of 0 corresponds to an inactive output.

Writing a 1 or 0 to an output that has not been configured for program control will have no effect on the output.

NOTE: The number of programmable digital outputs varies depending on amplifier model. See the amplifier documentation.

	Bit	Output
4	0	Digital Output 1
1	1	Digital Output 2
1	2	Digital Output 3
	3	Digital Output 4

Reading Output States (0xab)

Reading 0xab gets the active/inactive states of all the amplifier's digital outputs, including those which are not set to program control.

Reading/Setting Output Example

The controller configures 2 outputs for program control, reads the state of the outputs, and then sets an output low.

	mmand 0x72 258 0	Response ok	Comment Configures output 3 to program control, active low.	
	0x73 258 0	ok	Configures output 4 to program control, active low.	47/0
	Oxab	v 10	Reads the state of the outputs. Example returns a value of 10.	2,00
9			Converting this value to binary equals 1010 which indicates outputs 2 and 4 are active.	7
	Oxab 4	ok	4 converted to binary equals 0100. This value will set Output 4 inactive and Output 3 active. Outputs 4 and 3 have been programmed active low so Output 4 will be high and 3 will be low. Since Outputs 1 and 2 are not under program control, they will not change state.	Skogney.
The Risk	anualis mad	or which a	inactive and Output 3 active. Outputs 4 and 3 have been programmed active low so Output 4 will be high and 3 will be low. Since Outputs 1 and 2 are not under program control, they will not change state.

A: QUICK REFERENCE TO THE VARIABLES

This chapter provides quick reference to the variables described in this manual. Contents include: A.1: Variables by Function	Oalic Pr
This chapter provides quick reference to the variables described in this manual. Contents include: A.1: Variables by Function	50
Copley Controls Corp.	49

A.1: Variables by Function

Programmed Current Mode Variables 0x02 Programmed current value: Units: 0.0. 0x6a Current ramp rate. Units: mA/second. Analog Current Mode Variables 0x19 Analog input dead band. Units: mV. 0x1a Digital input scaling factor. Units: 0.01 A. 0x28 Digital input scaling factor. Units: 0.01 A. 0x29 Digital input scaling factor. Units: 0.01 A. 0x29 Digital input scaling factor. Units: 0.1 counts/second. 0x20 Programmed velocity Mode Variables 0x21 Programmed velocity mode Variables 0x21 Programmed velocity mode Variables 0x22 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x29 Analog input dead band. Units: mV. 0x1a Analog input dead band. Units: mV. 0x1a Analog input dead band. Units: mV. 0x36 Velocity acceleration limit. Units: 1000 counts/second? 0x37 Velocity acceleration limit. Units: 1000 counts/second? 0x39 Fast stop ramp. Units: 1000 counts/second? 0x39 Fast stop ramp. Units: 1000 counts/second? 0x39 Fast stop ramp. Units: 1000 counts/second? 0x30 Velocity deceleration limit. Units: 1000 counts/second? 0x30 Fast stop ramp. Units: 1000 counts/second? 0x31 Velocity deceleration limit. Units: 1000 counts/second? 0x32 Fast stop ramp. Units: 1000 counts/second? 0x33 Fast stop ramp. Units: 1000 counts/second? 0x34 Velocity deceleration limit. Units: 1000 counts/second? 0x35 Fast stop ramp. Units: 1000 counts/second? 0x36 Velocity deceleration limit. Units: 1000 counts/second?		and Original Mode Veriables	٦
0x1a Analog input offset. Units: mV. PWM Current Mode Variables 0xa9 Digital input scaling factor. Units: 0.01 A. 0xa8 Digital input command configuration. Programmed Velocity Mode Variables 0x2f Programmed velocity command. Units: 0.1 counts/second. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x19 Analog input scaling factor. Units: 0.1 counts/second 0x26 Analog input dead band. Units: mV. 0x3a Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x49 Scaling Factor. Units: 0.1 counts/second. 0x40 Velocity Mode Variables 0x41 Velocity Mode Variables 0x42 Velocity Mode Variables 0x43 Velocity deceleration limit. Units: 1000 counts/second² 0x45 Velocity deceleration limit. Units: 1000 counts/second² 0x46 Velocity deceleration limit. Units: 1000 counts/second²			-
0x1a Analog input offset. Units: mV. PWM Current Mode Variables 0xa9 Digital input scaling factor. Units: 0.01 A. 0xa8 Digital input command configuration. Programmed Velocity Mode Variables 0x2f Programmed velocity command. Units: 0.1 counts/second. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x19 Analog input scaling factor. Units: 0.1 counts/second 0x26 Analog input dead band. Units: mV. 0x3a Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x49 Scaling Factor. Units: 0.1 counts/second. 0x40 Velocity Mode Variables 0x41 Velocity Mode Variables 0x42 Velocity Mode Variables 0x43 Velocity deceleration limit. Units: 1000 counts/second² 0x45 Velocity deceleration limit. Units: 1000 counts/second² 0x46 Velocity deceleration limit. Units: 1000 counts/second²			- 2
0x1a Analog input offset. Units: mV. PWM Current Mode Variables 0xa9 Digital input scaling factor. Units: 0.01 A. 0xa8 Digital input command configuration. Programmed Velocity Mode Variables 0x2f Programmed velocity command. Units: 0.1 counts/second. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x19 Analog input scaling factor. Units: 0.1 counts/second 0x26 Analog input dead band. Units: mV. 0x3a Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² 0x49 Scaling Factor. Units: 0.1 counts/second. 0x40 Velocity Mode Variables 0x41 Velocity Mode Variables 0x42 Velocity Mode Variables 0x43 Velocity deceleration limit. Units: 1000 counts/second² 0x45 Velocity deceleration limit. Units: 1000 counts/second² 0x46 Velocity deceleration limit. Units: 1000 counts/second²		<u> </u>	- 7/1/
0x1a Analog input offset. Units: mV. PWM Current Mode Variables 0xa9 Digital input scaling factor. Units: 0.01 A. 0xa8 Digital input command configuration. Programmed Velocity Mode Variables 0x2f Programmed velocity command. Units: 0.1 counts/second. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² Analog Velocity Mode Variables 0x19 Analog input dead band. Units: nV. 0x26 Analog input dead band. Units: mV. 0x31 Analog input offset. Units: mV. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x39 Fast stop ramp. Units: 1000 counts/second² PWM Velocity Mode Variables 0xa9 Scaling Factor. Units: 0.1 counts/second. 0x36 Velocity acceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second² 0x37 Velocity deceleration limit. Units: 1000 counts/second²			- 400.
0x1a Analog input offset. Units: mV. PWM Current Mode Variables 0xa9 Digital input scaling factor. Units: 0.01 A. 0xa8 Digital input command configuration. 0xc8	Profile type:
	0 = Absolute move, trapezoidal profile. 1 = Absolute move, S-curve profile.
	256 = Relative move, trapezoidal profile. 257 = Relative move, S-curve profile.
	2 = Velocity profile.
0xca	Position command:
	Relative move = the distance of the move. Absolute move = the target position of the move. Velocity move = 1 for positive direction, -1 for negative direction. Units: counts.
0xcb	Maximum velocity. Units: 0.1 counts/second.
0xcc	Maximum acceleration rate. Units: 10 counts/second ² .
0xcd	Maximum deceleration rate. Units: 10 counts/second ² .
0xce	Maximum jerk rate. Units: 100 counts/ second ³ .
0xcf	Abort deceleration rate. Units: 10 counts/second ² .
Analog	g Position Mode Variables
0x19	Analog input scaling factor. Units: counts.
0x26	Dead band. Units: mV.
0xcb	Maximum velocity. Units: 0.1 counts/second.
0xcc	Maximum acceleration rate. Units: 10 counts/second ² .
0xcd	Maximum deceleration rate. Units: 10 counts/second ²
0xcf	Abort deceleration rate. Units: 10 counts/second ²
Pulse	and Direction Mode Variables
0xa8	Digital Command Configuration.
	Pulse and Direction: 4096 = Increment position on rising edge. 0 = Increment position on falling edge.
0xa9	Scaling factor. Output counts/Input pulses.
0xcb	Maximum velocity. Units: 0.1 counts/second.
0xcc	Maximum acceleration rate. Units: 10 counts/second ² .
0xcd	Maximum deceleration rate. Units: 10 counts/second ² .
0xcf	Abort deceleration rate. Units: 10 counts/second ² .
Pulse	Up/Down Mode Variables
0xa8	Digital Command Configuration. Pulse Up/Down Mode: 4352 = Increment position on rising edge. 256 = Increment position on falling edge.
0xa9	Input / Output Ratio.
0xcb	Maximum velocity. Units: 0.1 counts/second.
7	Maximum acceleration rate. Units: 10 counts/second ² .
0xcc	Maximum deceleration rate. Units: 10 counts/second ² .
0xcc 0xcd 0xcf	Maximum deceleration rate. Onlts: 10 counts/second .

0xa8	Digital Command Configuration. 512 = Quadrature Mode.
0xa9	Input / Output Ratio.
0xcb	Maximum velocity. Units: 0.1 counts/second.
Охсс	Maximum acceleration rate. Units: 10 counts/second ² .
0xcd	Maximum deceleration rate. Units: 10 counts/second ² .
0xcf	Abort deceleration rate. Units: 10 counts/second ² .
Homir	ng Mode Variables
0xc2	Homing Method. See table below for values.
0xc3	Fast Velocity. Units: counts/second
0xc4	Slow Velocity. Units: counts/second
0xc5	Acceleration / Deceleration. Units: 10 counts/second ² .
0xc6	Home Offset. Units: counts.
0xc7	Current Limit. Units: 0.01 A.
0xbf	Current Delay Time. Units: milliseconds.
0xb8	Positive Software Limit. Units: counts.
0xb9	Negative Software Limit. Units: counts.
Curre	nt Loop Limits Variables
0x21	Peak current limit. Units: 0.01 A.
0x23	I ² T time limit. Units: mS.
0x22	Continuous current limit. Units: 0.01 A.
0xae	Current loop offset. Units: 0.01 A.
Curre	nt Loop Gains Variables
0x00	Current loop proportional gain (Cp).
0x01	Current loop integral gain (Ci).
Veloci	ity Loop Limits Variables
0x3a	Velocity loop velocity limit. Units: 0.01 counts/second.
0x36	Velocity loop acceleration limit. Units: 1000 counts/second ² .
0x37	Velocity loop deceleration Limit. Units: 1000 counts/second ² .
0xcf	Fast Stop Ramp. Units: 10 counts/second ²
Veloci	ity Loop Gains Variables
0x27	Velocity loop proportional gain (Vp).
0x28	Velocity loop integral gain (Vi).
Veloci	ty Loop Filters Variables
0x6b	Velocity loop command filter co-efficients.
0x5f	Velocity loop output filter co-efficients.
	on Loop Gains Variables
	Pp - Position loop proportional gain.
Position 0x30	
	Vff - Velocity feed forward.
0x30	Vff - Velocity feed forward. Aff - Acceleration feed forward.

	t Loop Run Time Variables	
0x15	Commanded current. Units: 0.01 A.	
0x0c	Actual current. Units: 0.01 A.	
0x25	Limited current. Units: 0.01 A.	. CProdi

B: CME 2 ASCII COMMAND LINE TOOL

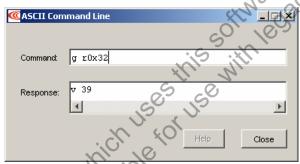

The CME 2 ASCII Command Line tool lets users send individual ASCII commands to amplifiers.

continuiting to the continuities of the contin From the CME 2 Main screen, choose Tools->ASCII Command Line to open the **ASCII Command Line tool:**

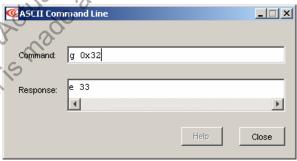

- Enter an ASCII command in the Command field.
- Press the Enter key to send the command to the amplifier. Observe the response in the Response field.

If a value is returned, it is preceded by the letter "v." In the following example, the get command was used to retrieve the RAM value of variable 0x32 (actual position).

An error code is preceded by the letter "e." In the following example, the get command was entered without the required memory bank designation, resulting in an ASCII command parsing error (error code 33). See *Error Codes* (p. 75).

TIP: To view an error definition, hold the mouse pointer over the error number.

The LR-snaral Engle and all alle for use with legacy less that the state of the sta

C.1: Homing Methods Overview

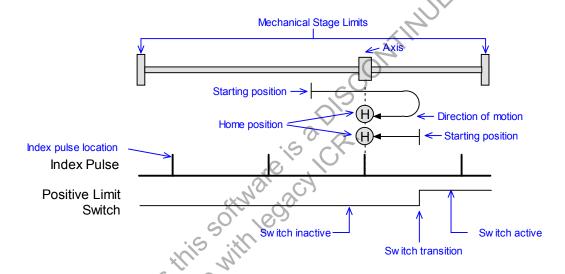

There are several homing methods. Each method establishes the:

- Direction of motion and, where appropriate, the relationship of the index pulse to limit or home switches.

 2: Legend to Homing Method Descriptions

C.2: Legend to Homing Method Descriptions

As highlighted in the example below, each homing method diagram shows the starting position on a mechanical stage. The arrow line indicates direction of motion, and the circled H indicates the home position. Solid line stems on the index pulse line indicate index pulse locations. Longer dashed lines overlay these stems as a visual aid. Finally, the relevant limit switch is represented. showing the active and inactive zones and transition.

ethod desc which the for the ICR smartialis made available for the ICR smartialis made available for Note that in the homing method descriptions, negative motion is leftward and positive motion is

C.3: Homing Method Descriptions

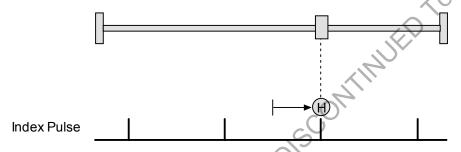

C.3.1: Set current position as home

Direction of Motion: N/A (0xc2 = 512) The current position is the home position.

C.3.2: Next Index

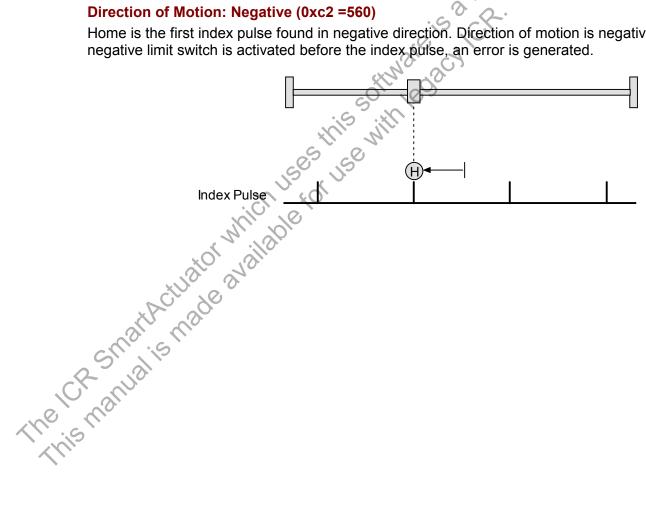

Direction of Motion: Positive (0xc2 = 544)

Home is the first index pulse found in the positive direction. Direction of motion is positive. If a positive limit switch is activated before the index pulse, an error is generated.

Direction of Motion: Negative (0xc2 = 560)

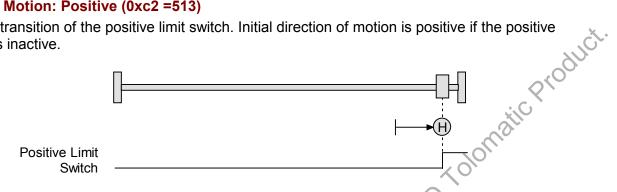

Home is the first index pulse found in negative direction. Direction of motion is negative. If a negative limit switch is activated before the index pulse, an error is generated.

C.3.3: Limit Switch

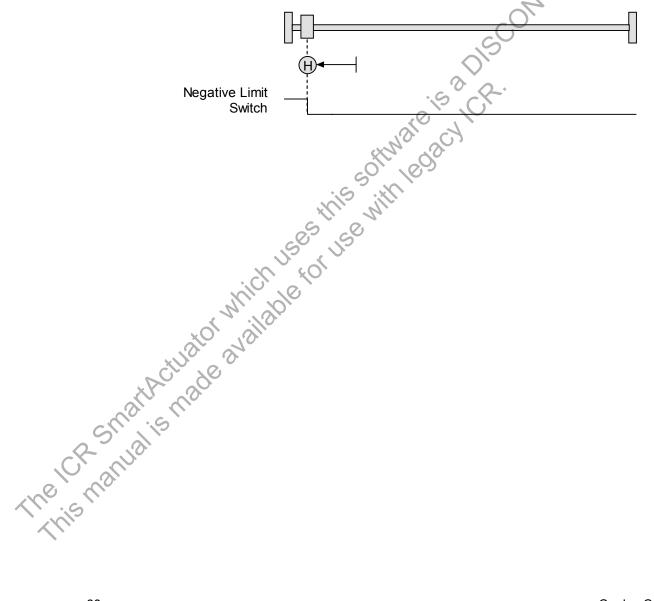

Direction of Motion: Positive (0xc2 =513)

Home is the transition of the positive limit switch. Initial direction of motion is positive if the positive limit switch is inactive.

Direction of Motion: Negative (0xc2 =529)

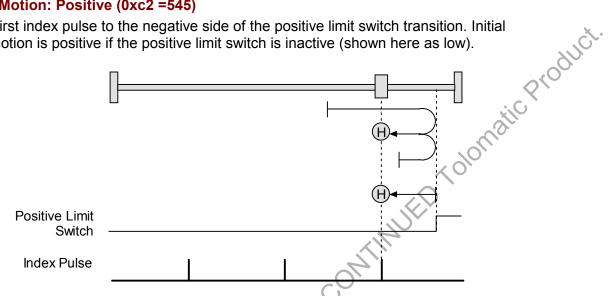

Home is the transition of negative limit switch. Initial direction of motion is negative if the negative limit switch is inactive.

C.3.4: Limit Switch Out to Index

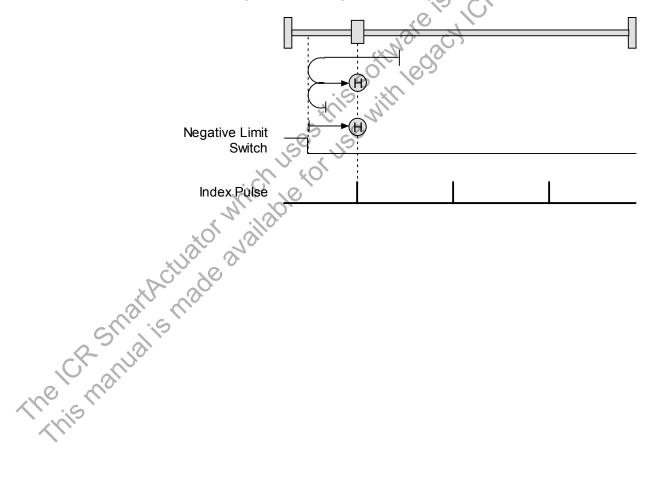

Direction of Motion: Positive (0xc2 = 545)

Home is the first index pulse to the negative side of the positive limit switch transition. Initial direction of motion is positive if the positive limit switch is inactive (shown here as low).

Direction of Motion: Negative (0xc2 =561)

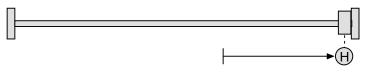

Home is the first index pulse to the positive side of the negative limit switch transition. Initial direction of motion is negative if the negative limit switch is inactive (shown here as low).

C.3.5: Hardstop

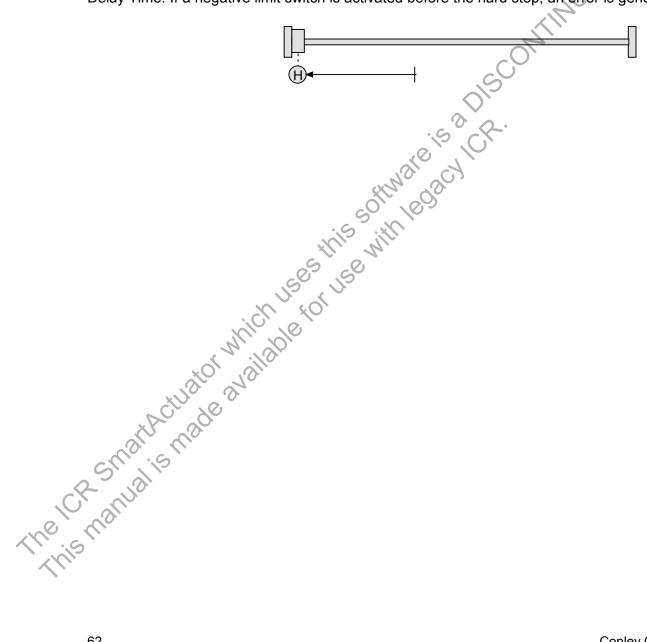

Direction of Motion: Positive (0xc2 = 516)

olomatic Product. Home is the positive hard stop. Direction of motion is positive. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a positive limit switch is activated before the hard stop, an error is generated.

Direction of Motion: Negative (0xc2 =532)

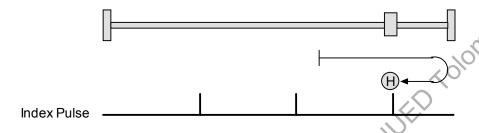

Home is the negative hard stop. Direction of motion is negative. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a negative limit switch is activated before the hard stop, an error is generated.

C.3.6: Hardstop Out to Index

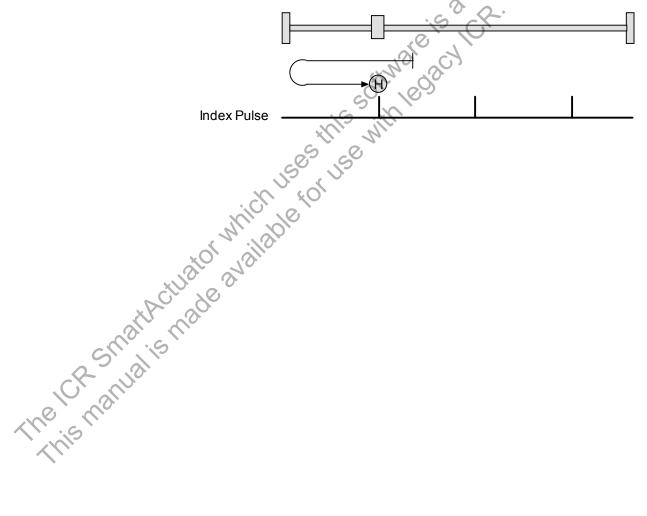

Direction of Motion: Positive (0xc2 = 548)

Plowstic Product. Home is the first index pulse on the negative side of the positive hard stop. Initial direction of motion is positive. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a positive limit switch is activated before the hard stop, an error is generated.

Direction of Motion: Negative (0xc2 = 564)

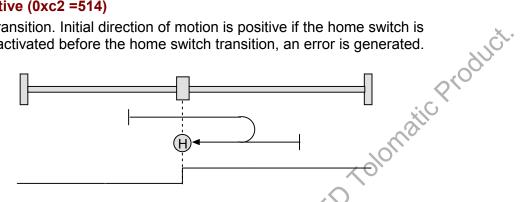

Home is the first index pulse on the positive side of the negative hard stop. Initial direction of motion is negative. The hard stop is reached when the amplifier outputs the homing Current Limit continuously for the amount of time specified in the Delay Time. If a negative limit switch is activated before the hard stop, an error is generated.

C.3.7: Home Switch

Direction of Motion: Positive (0xc2 = 514)

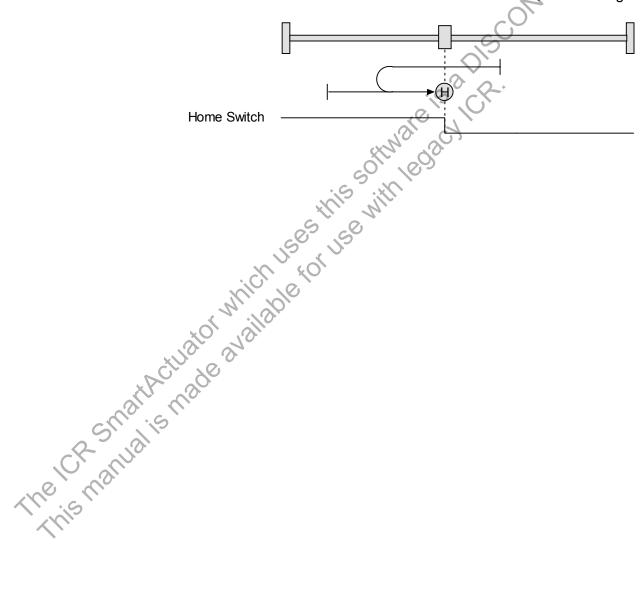

Home is the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Home Switch

Direction of Motion: Negative (0xc2 =530)

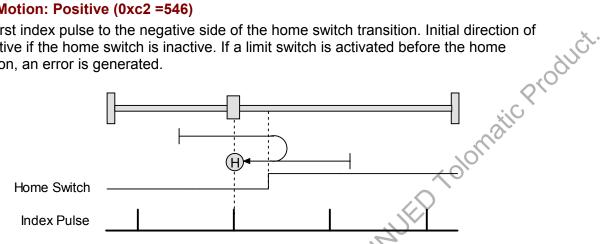

Home is the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

C.3.8: Home Switch Out to Index

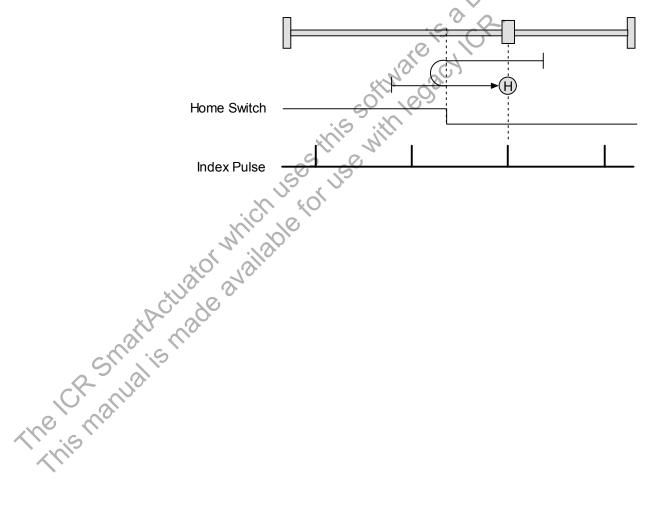

Direction of Motion: Positive (0xc2 = 546)

Home is the first index pulse to the negative side of the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Direction of Motion: Negative (0xc2 = 562)

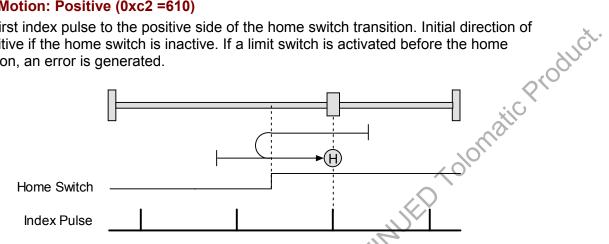

Home is the first index pulse to the positive side of the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

C.3.9: Home Switch In to Index

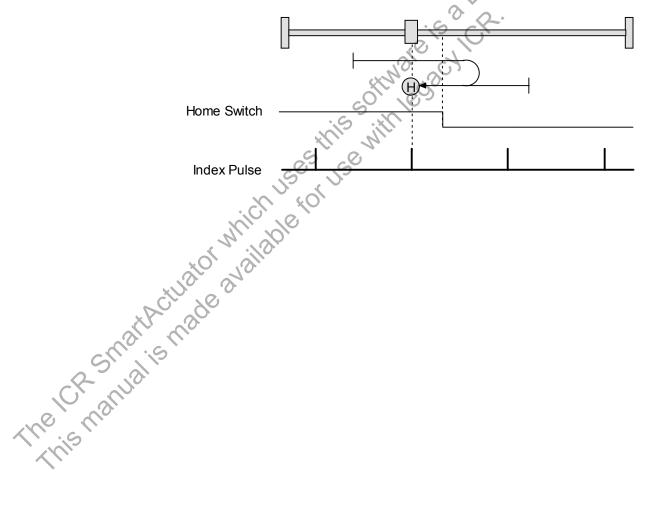

Direction of Motion: Positive (0xc2 =610)

Home is the first index pulse to the positive side of the home switch transition. Initial direction of motion is positive if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

Direction of Motion: Negative (0xc2 =626)

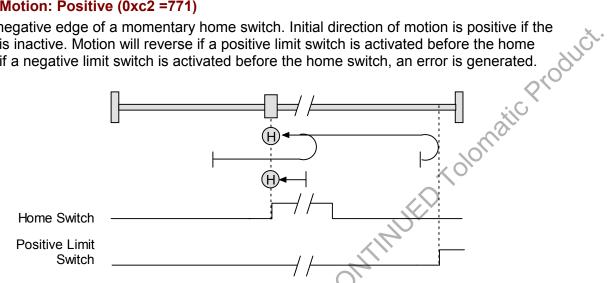

Home is the first index pulse to the negative side of the home switch transition. Initial direction of motion is negative if the home switch is inactive. If a limit switch is activated before the home switch transition, an error is generated.

C.3.10: Lower Home

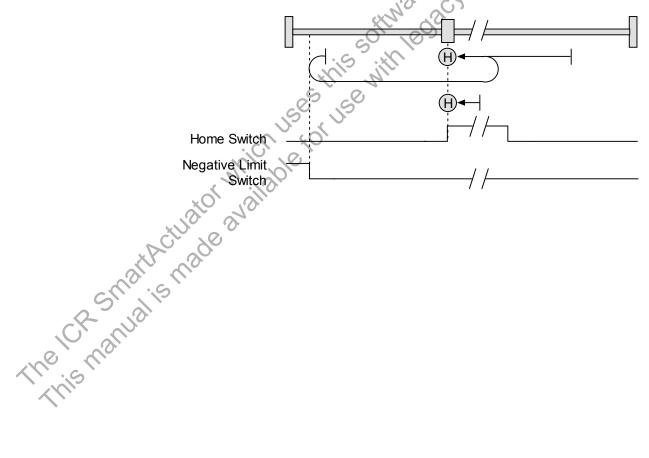

Direction of Motion: Positive (0xc2 =771)

Home is the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. Motion will reverse if a positive limit switch is activated before the home switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 = 787)

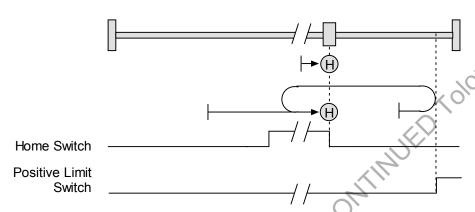

Home is the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a positive limit switch is activated before the home switch, an error is generated.

C.3.11: Upper Home

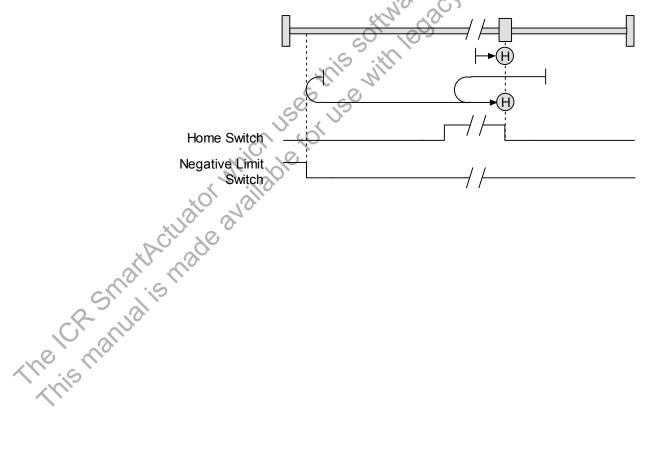

Direction of Motion: Positive (0xc2 = 515)

Home is the positive edge of a momentary home switch. Initial direction of motion is positive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 =531)

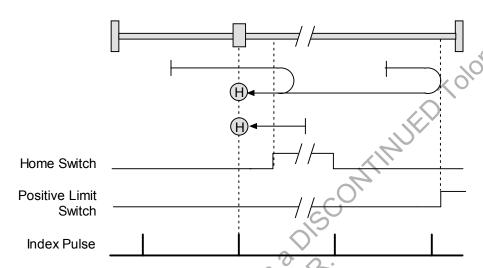

Home is the positive edge of momentary home switch. Initial direction of motion is negative if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a positive limit switch is activated before the home switch, an error is generated.

C.3.12: Lower Home Outside Index

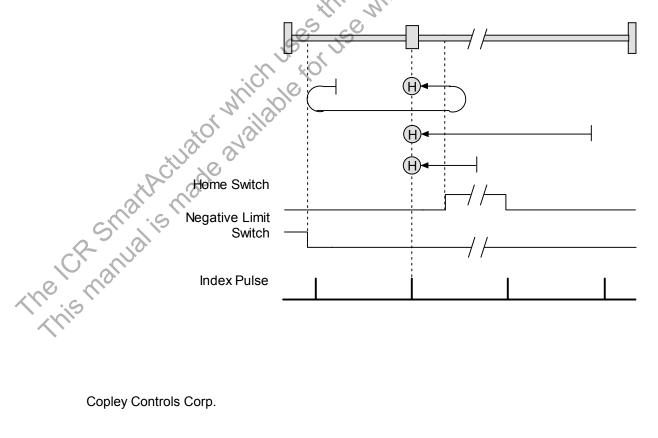

Direction of Motion: Positive (0xc2 =803)

domatic Product Home is the first index pulse on the negative side of the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 =819)

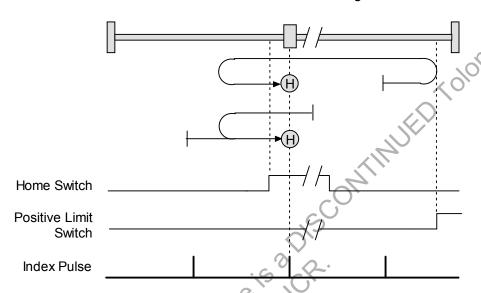

Home is the first index pulse on the negative side of the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

C.3.13: Lower Home Inside Index

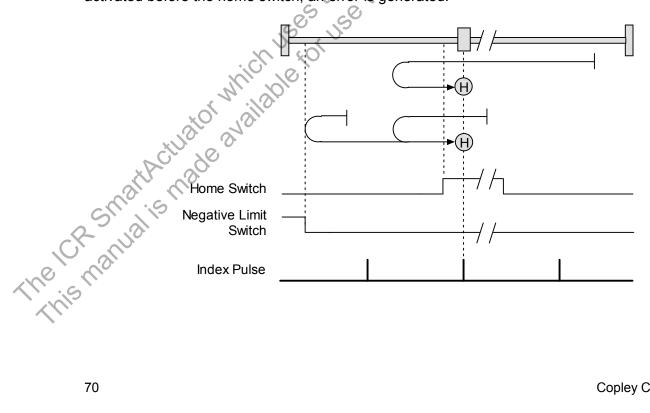

Direction of Motion: Positive (0xc2 =867)

Home is the first index pulse on the positive side of the negative edge of a momentary home switch. Initial direction of motion is positive if the home switch is inactive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 =883)

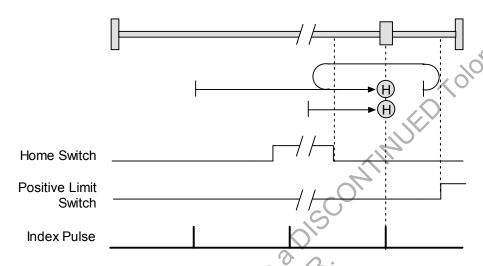

Home is the first index pulse on the positive side of the negative edge of a momentary home switch. Initial direction of motion is negative. If the initial motion leads away from the home switch, the axis reverses on encountering the negative limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

C.3.14: Upper Home Outside Index

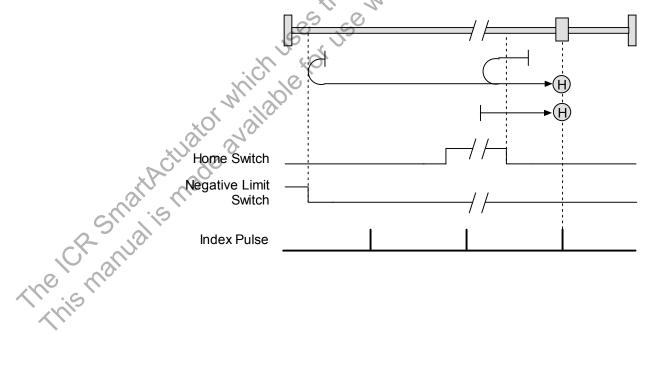

Direction of Motion: Positive (0xc2 = 547)

domatic Product. Home is the first index pulse on the positive side of the positive edge of a momentary home switch. Initial direction of motion is positive. If the initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 = 563)

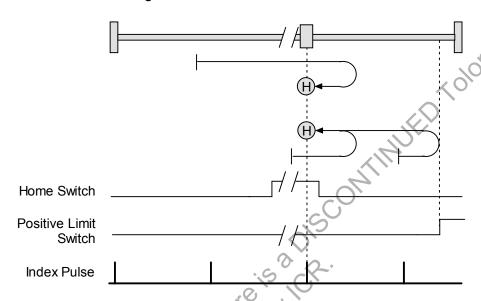

Home is the first index pulse on the positive side of the positive edge of a momentary home switch. Initial direction of motion is negative if the home switch is inactive. If the initial position is right of the home position, the axis reverses on encountering the home switch.

C.3.15: Upper Home Inside Index

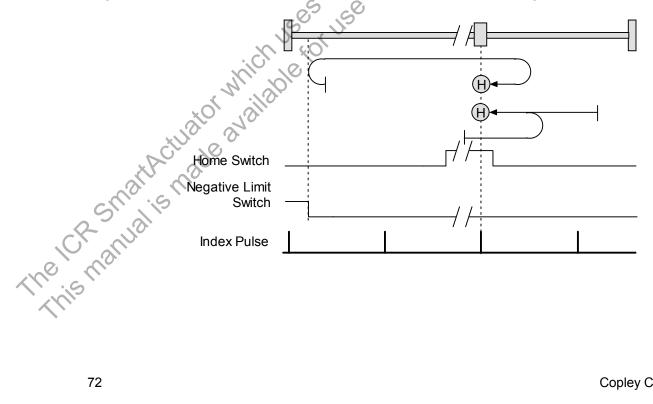

Direction of Motion: Positive (0xc2 =611)

Colomatic Product. Home is the first index pulse on the negative side of the positive edge of momentary home switch. Initial direction of motion is positive. If initial motion leads away from the home switch, the axis reverses on encountering the positive limit switch; then, if a negative limit switch is activated before the home switch, an error is generated.

Direction of Motion: Negative (0xc2 =627)

Home is the first index pulse on the negative side of the positive edge of a momentary home switch. Initial direction of motion is negative if the home switch is inactive. If initial motion leads away from the home switch, the axis reverses on encountering the negative limit; then, if a negative limit switch is activated before the home switch, an error is generated.

APPENDIX

D: SERIAL AND MULTI-DROP CONNECTI	ON BUCK
This appendix describes how to connect an amplifier for control via the RS-232 serial port.	CPRO
The serially connected amplifier can also be used as a multi-drop gateway to control other amplifiers linked in a series of CAN bus connections.	
Contents include: Section	Page
D.1: Connecting	74 74 74

D.1: Connecting

Instructions for hooking up a single-axis connection and a multi-drop network appear below.

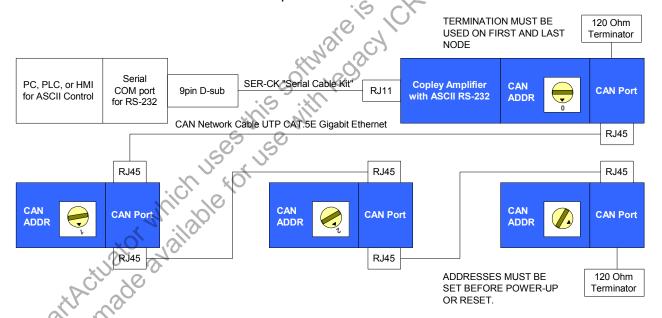

D.1.1: Single-Axis Connections

For RS-232 serial bus control of a single axis, set the CAN node address of that axis to zero (0). Note that if the CAN node address is switched to zero after power-up, the amplifier must be reset or power cycled to make the new address setting take effect.

D.1.2: Multi-Drop Network Connections

For RS-232 serial bus control of multiple axes, set the CAN node address of the serially connected amplifier (gateway) to zero (0). Assign each additional amplifier in the chain a unique CAN node address value between 1 and 127. For information on CAN node address, see the amplifier user guide or data sheet. Verify that all amplifiers are set to the same CAN bit rate. Use $120~\Omega$ termination on the first and last amplifier.

The CAN Status Light and Multi-Drop Connections

When starting amplifiers on a multi-drop CAN loop, it is common to see a green-green-red flash sequence on the CAN Status Indicator LED of the first amplifier to start up. This sequence indicates that the amplifier has not found any other active nodes on the CAN loop. Under normal circumstances, this flash sequence does not indicate a problem, and it will clear after the first few commands are sent to the amplifier.

To avoid seeing this flash sequence, assure that the gateway amplifier starts up first. The CAN status indicator will always be off on node 0.

APPENDIX

E: ERROR CODES

Most ASCII Interface commands can return an error message in the format "e <code>" where code is one of the error code numbers described below.

Code	Meaning
1	Too much data passed with command
3	Unknown command code.
4	Not enough data was supplied with the command.
5	Too much data was supplied with the command.
9	Unknown variable ID.
10	Data value out of range.
11	Attempt to modify read-only variable
14	Unknown axis state.
15	Variable doesn't exist on requested page.
18	Illegal attempt to start a move while currently moving
19	Illegal velocity limit for move.
20	Illegal acceleration limit for move.
21	Illegal deceleration limit for move.
22	Illegal jerk limit for move.
25	Invalid trajectory mode.
27	Command is not allowed while CVM is running
31	Invalid node ID for serial port forwarding.
32	CAN Network communications failure.
33	ASCII command parsing error.
CR Sman	CAN Network communications failure ASCII command parsing error.
